Abstract
Road accident data analysis plays an important role in identifying key factors associated with road accidents. These associated factors help in taking preventive measures to overcome the road accidents. Various studies have been done on road accident data analysis using traditional statistical techniques and data mining techniques. All these studies focus on identifying key factors associated with road accidents in different countries. Road accident is uncertain and unpredictable events which occur in any circumstances. Also, road accidents do not have similar impacts in every region of the districts. There are chances that road accidents take its root in a certain district but it has some lower impact in other districts. Hence, the more focus on road safety should be on those regions or districts where road accidents trend is increasing. Time series analysis is an important area of study which can be helpful in identifying the increasing or decreasing trends in different districts. In this paper, we have proposed a framework to analyze road accident time series data that takes 39 time series data of 39 districts of Uttar Pradesh and Uttarakhand states of India. This framework segments the time series data into different clusters. A time series merging algorithm is proposed to find the representative time series (RTS) for each cluster. This RTS is further used for trend analysis of different clusters. The results reveal that road accident trend is going to increase in certain districts and those districts should be the prime concern to take preventive measures to overcome the road accidents.

Keywords: Road accidents, Time series, Data mining, Clustering, Trend analysis

Background
Road traffic accident (RTA) is one of the important concerns of research as it involves fatality, personal injuries that can lead to full or partial disability and property damage. A report [1] by World Health Organization (WHO) reveals that there are 1.2 million fatal and about four times injured road accidents every year across the world. Road and traffic safety is a term associated with road accidents. The primary focus of road safety is to provide some preventive measures that can be helpful in reducing RTAs. Road accident data analysis is an important factor that has been successful in identifying different factors associated with road accidents [2–5]. Once the associated road accident factors are identified the corresponding actions can be taken to overcome the accident rate and to apply some preventive measures. Road accident data analysis is mainly based on two categories: statistical techniques and data mining techniques. Various studies on
